

Figure S1. Alternatively spliced isoform *OIPax2.1(del35)*. Dark grey boxes represent constitutive exons, red box shows part of exon 2 (35 bp) deleted in *OIPax2.1*. Thin line represents intron 2. Intron sequence is not known, due to a non-sequenced region in *O. latipes* genome. Canonical splice sites are in blue letters. Red star represents the premature stop codon caused due to the use of an alternative 5' splice donor (pink) and the subsequent frameshift. Blue arrowheads point to PAI a3 helix.
